

banker . cash

BANKER.CASH

A bank behind every coin.

01 · VAULT

A market maker the holders own

The first buy in the launch block. Sells into pumps, buys dips, never withdraws.

02 · SNIPER TAX

Snipers pay the chest

For the first 20 seconds, half of every sniper buy is sold straight back into it.

03 · DESK

OTC, off-chart

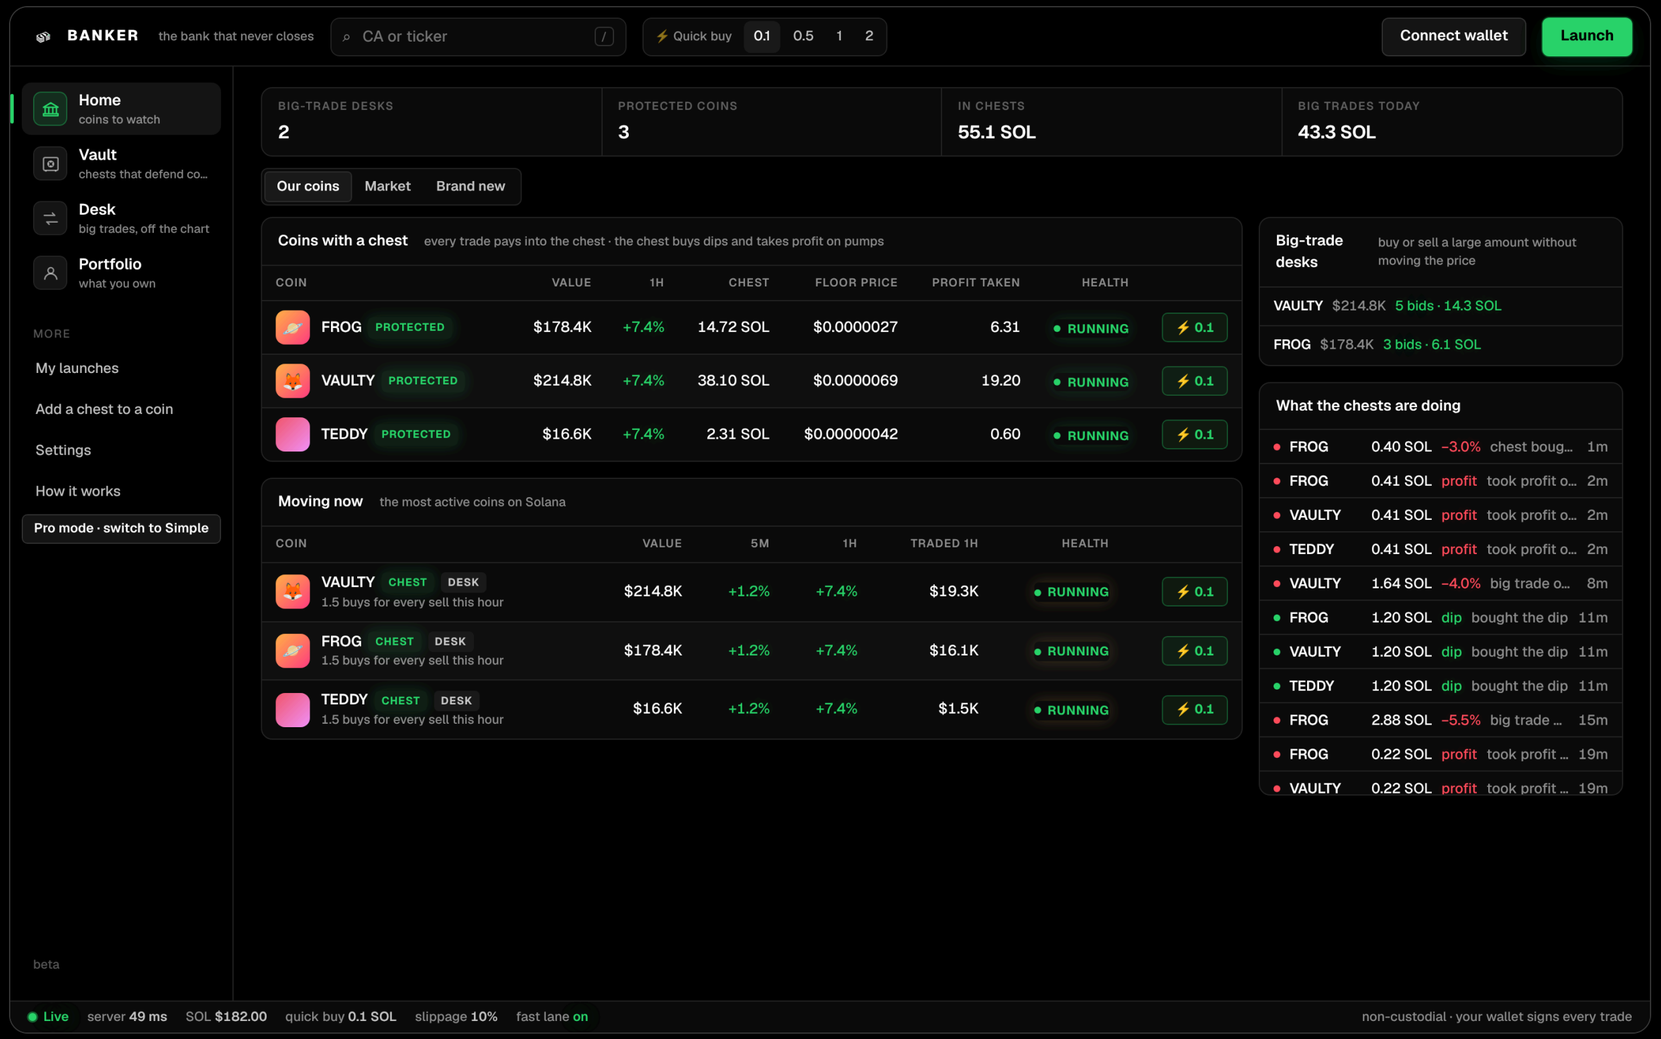

Sell or buy a block in one on-chain transaction. No candle.

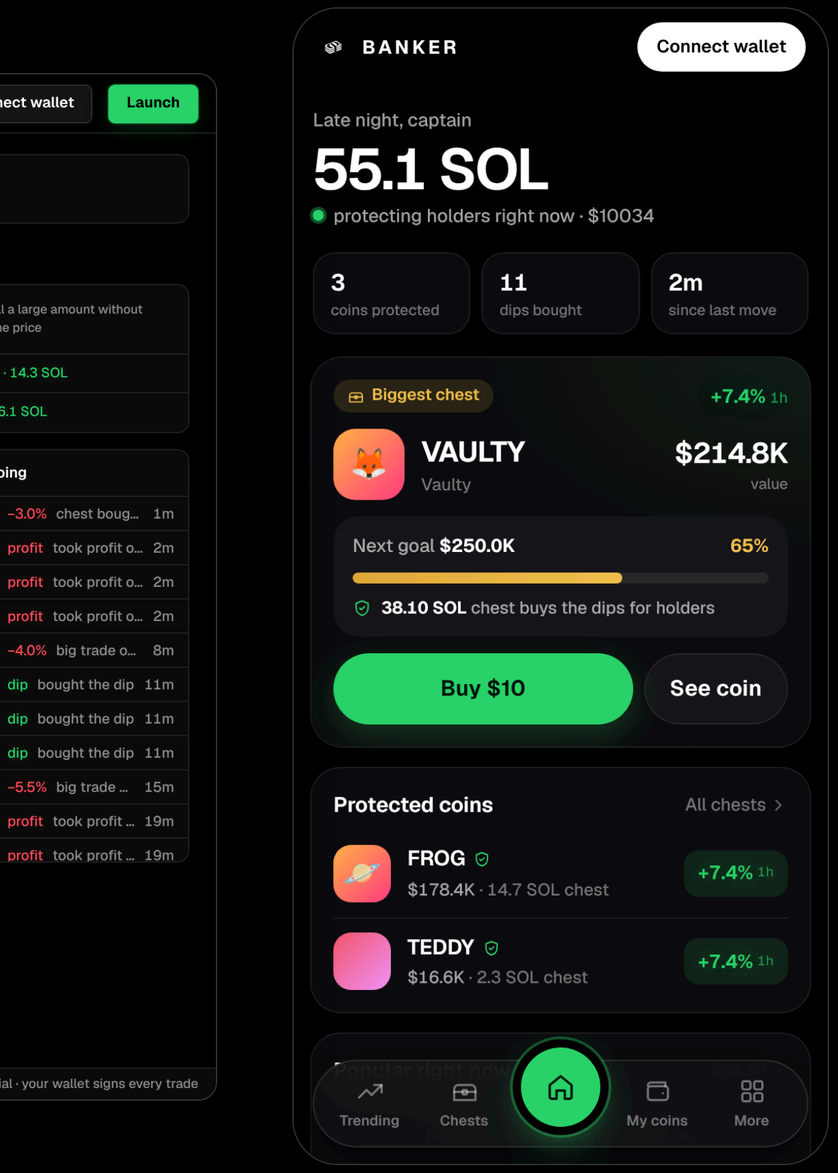

04 · VAMP DEFENSE

Copies pay the original

Clones are detected and their tax streams to the coin they copied.

On LaunchLab, 2% of every trade funds the chest. On pump.fun, the snipers do. One signature to launch either.

BLOCK ZERO

The coin's own chest is the first buy. Not a sniper.

You create the coin
one signature

→

Chest buys first
same Jito bundle, same block

→

Snipers buy
at a higher price

→

Chest sells into them
half of every buy, first 20 s

1 bundle

Coin, your buy and the chest's buy go out together. The chest's buy goes straight into pump's own program: no wrapper, no 0.5% fee.

0 launches

go live without the chest. The bundle is resent up to 3×, rebuilt if its blockhash ages; if it can't land, nothing launches and the stake stays put.

10%

of supply by default (≈3.3 SOL), bought at the lowest price the curve will ever have.

SNIPER TAX · NEW

pump.fun has no sell tax. We built one.

50%

of every sniper buy in the first 20 seconds, sold straight back into that buy by the chest. The SOL stays in the chest.

Snipers usually take the launch. Here they pay for the coin's floor.

42–48%

of all the SOL snipers put in during the first 10–30 s was captured by the chest, replayed on our two real launch tapes with a 7.3 SOL block-zero buy.

Guardrails, in code

Never sells under cost +1%. At most 10% of the pool per sale. 15% of the launch tokens kept for market making after the window.

Sniper report

Who bought in the first minute, how much landed in the launch block, what the chest sold into them. One tap posts it to X.

EXECUTION

Faster than the snipers it taxes.

processed

Buys are seen the moment they're processed and read from pump's own trade event: exact SOL and the curve after the buy. No extra RPC read.

websocket · pump TradeEvent

54.5k CU

The sale is built locally in pump's own format: no HTTP round trip, no third-party program. 793 bytes, measured on mainnet.

mainnet preflight · Oct 30

≤ 4%

of a sale ever goes to fees. The priority fee is priced from this pool's own recent fees, not the network average.

getRecentPrioritizationFees · per curve

Every tipped transaction carries Jito's do-not-front-run marker. Sent through Helius Sender and RPC at once, rebroadcast every 1.2 s, confirmation checked every 300 ms. A sale that can no longer land is re-queued, never sold twice. 77 of 77 real coins replayed tick by tick through the live market-maker code: zero invariant violations.

SECURITY

Every signature is checked before it's signed.

- **Simulated first.** The exact transaction is simulated and every transfer it would make, inside every program it calls, is walked before the keeper signs.
- **Hard limits.** Allowlisted programs only. The vault is the only signer. SOL out is bounded by the trade. A buy has to show the coin arriving.
- **No withdraw path.** Keeper caps per transaction and per hour. The dev is paid from realized profit only.
- **Attacks refused on mainnet.** A hidden 0.5 SOL drain, a token delegate, a foreign-token transfer and an oversized sell, each slipped into a real trade, were all refused.

3

independent reviews of the money path. Every finding fixed, each with a test.

48

checks against mainnet on every deploy: real bundles, real buys and sells, real attacks.

212

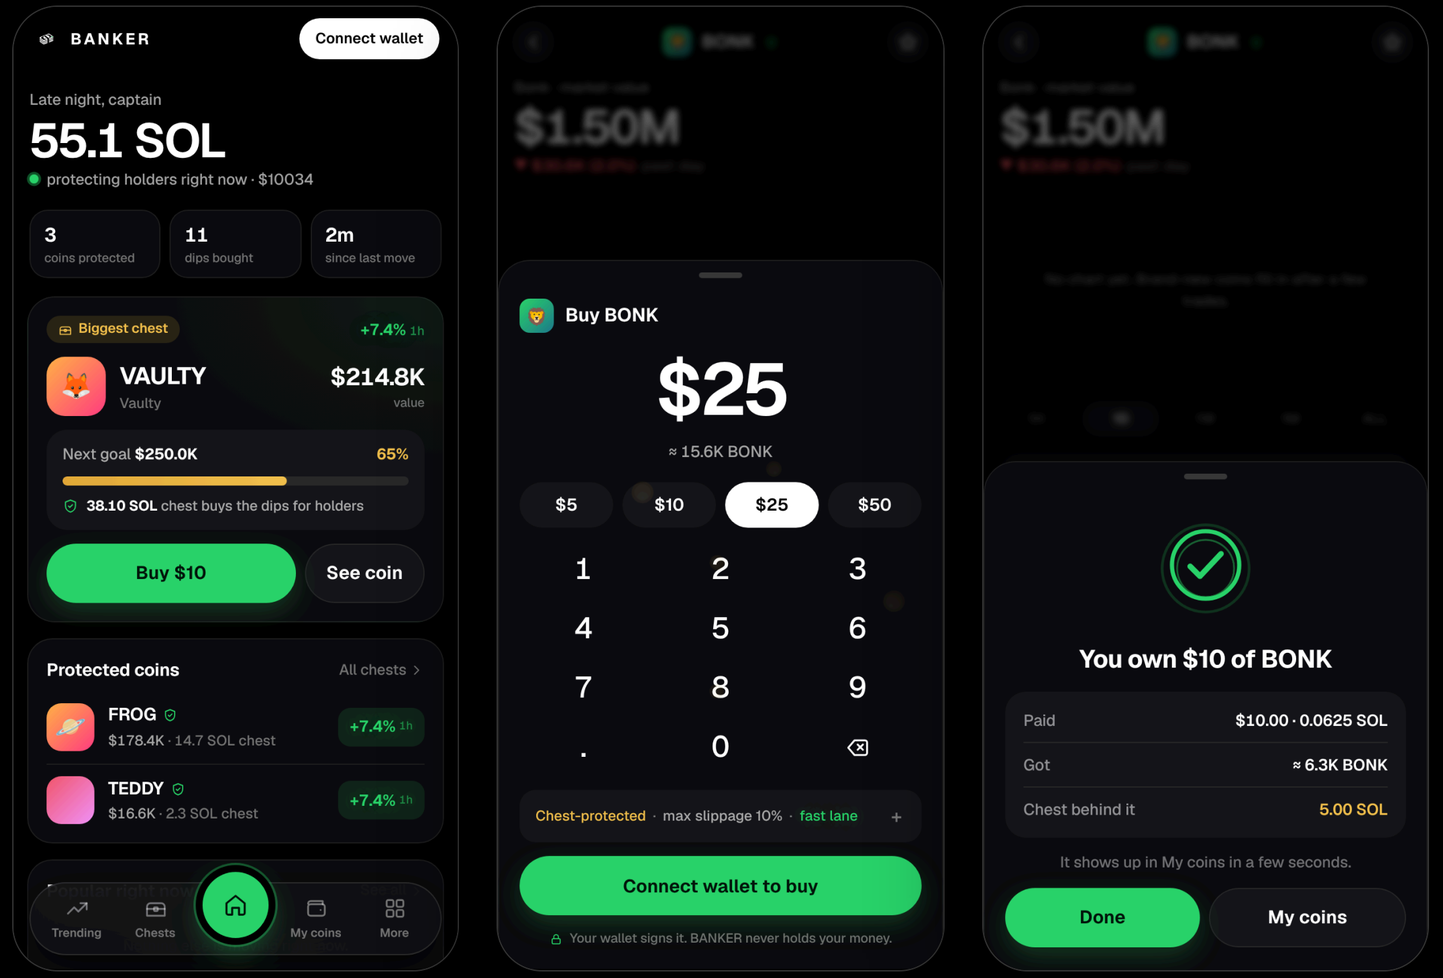

automated tests: 100 on the server, 112 end-to-end.

THE PHONE APP

Built for the guy who just wants to hold.

- **Dollars, not SOL.** A keypad, $5 / $10 / $25 / $50, slide to buy.
- **Every cost before you commit:** slippage, speed fee, what goes to the chest.
- **Plain safety checks** on every coin. Risky ones say Careful.
- **A goal to watch.** Each coin climbs a ladder of value milestones; the chest's ring fills.
- **Levels for holding**, never for trading more. No confetti on sells.

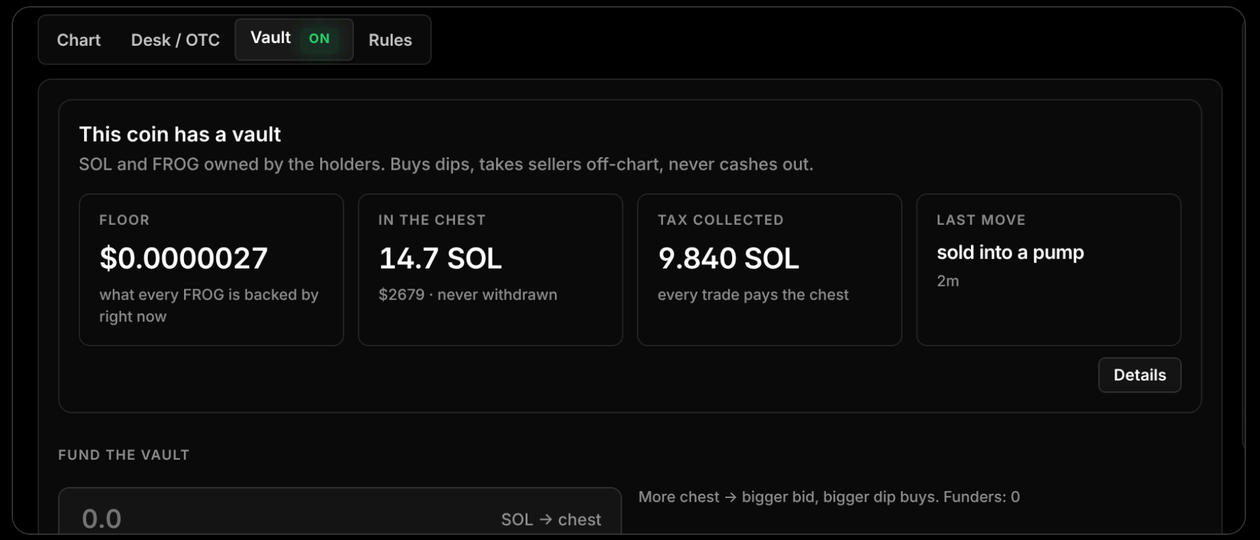

Same engine as the terminal. Pro mode is one tap away.

THE VAULT

A market maker the holders own.

- **Buys in block zero**, before any sniper.
- **Taxes the snipers:** half of every early buy sold back into it.
- **Sells into pumps** when price stretches over VWAP.
- **Buys dips** in tranches, only under VWAP, from its own chest.
- **Stands on the desk** as buyer of last resort and no-fee seller at spot.
- **Never withdraws.** The dev is paid a cut of realized profit only.

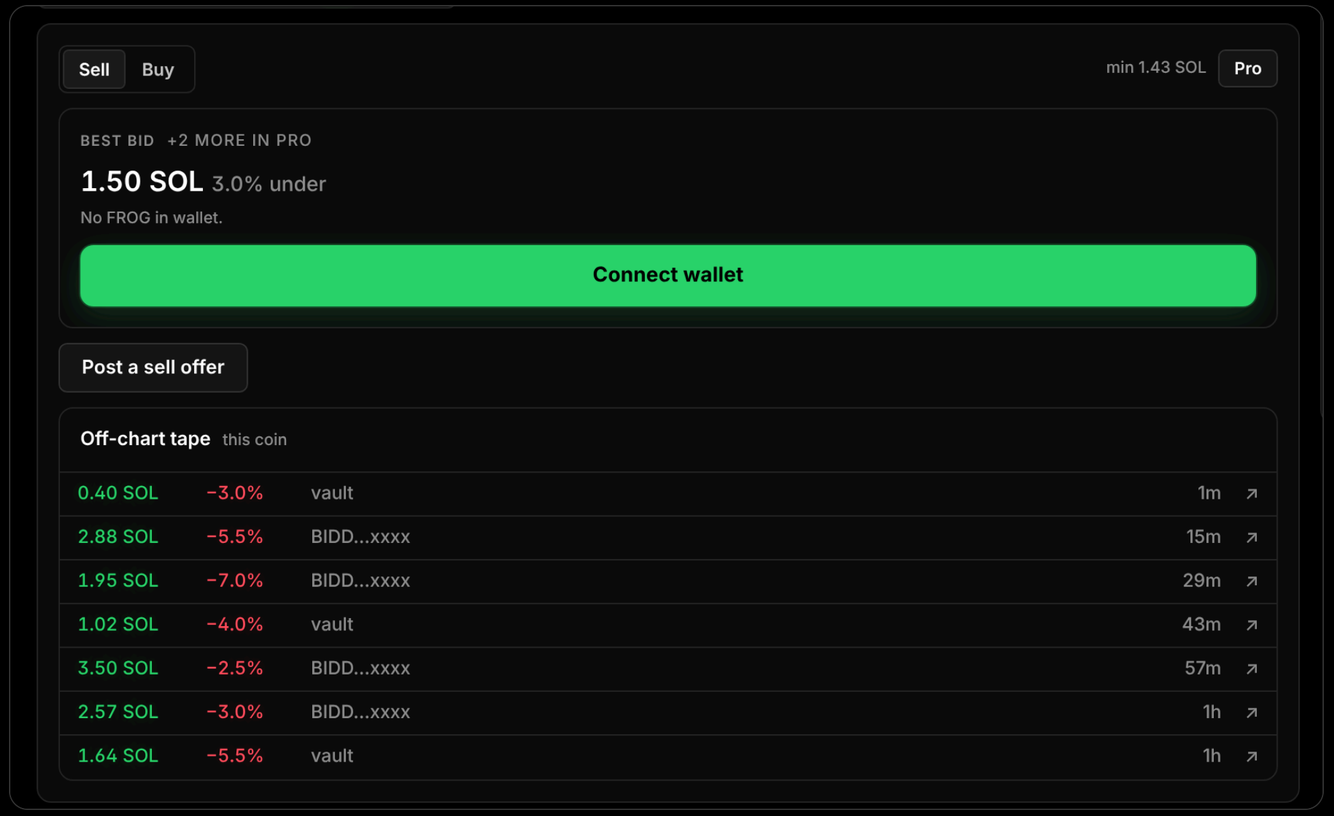

WHY IT HOLDS

Simulated against the people who will try to farm it.

24H ATTACK ON A 30% VAULT WITH A 5 SOL CHEST	CHEST AT ITS WORST	ATTACKER VS JUST HOLDING
Pump 30 SOL every hour, dump to −50%	−89% → −34%	−12.2 SOL
Dump through every tranche, wait, buy back, repeat	−79% → −46%	−0.95 SOL
Sell a block to the vault, then dump the chart	−83% → −23%	−1.1 SOL
Wash-buy to trigger captures for an hour	0% → 0%	vault +3 SOL chest

Naive policy → shipped policy. Crash budgets anchor to the crash, not a rolling window. Dips above VWAP aren't dips. One wallet behind the selling halves the budget. Toxic desk flow pulls the bid and bans the seller. Every signature passes a keeper with hard caps and no withdraw path.

The simulator runs the same policy file the live bot runs.

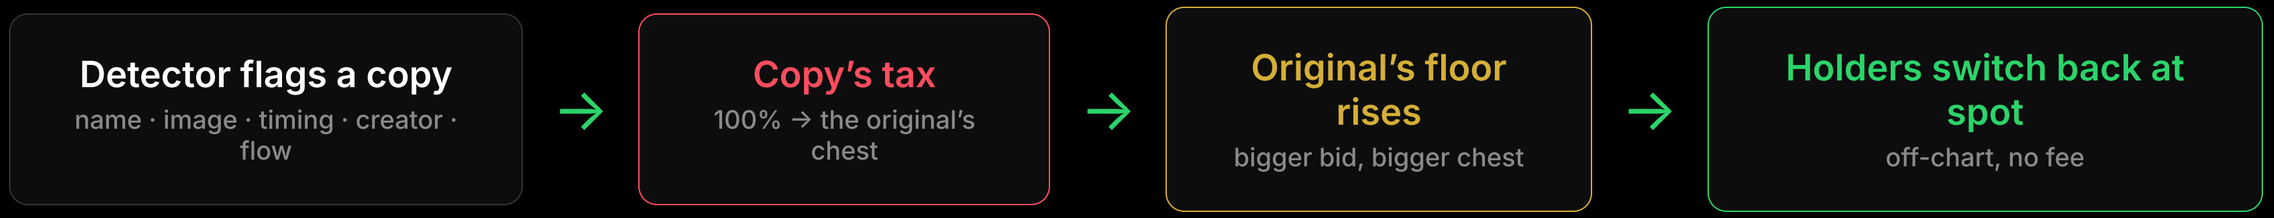

THE OTC DESK

Sell a block. No candle.

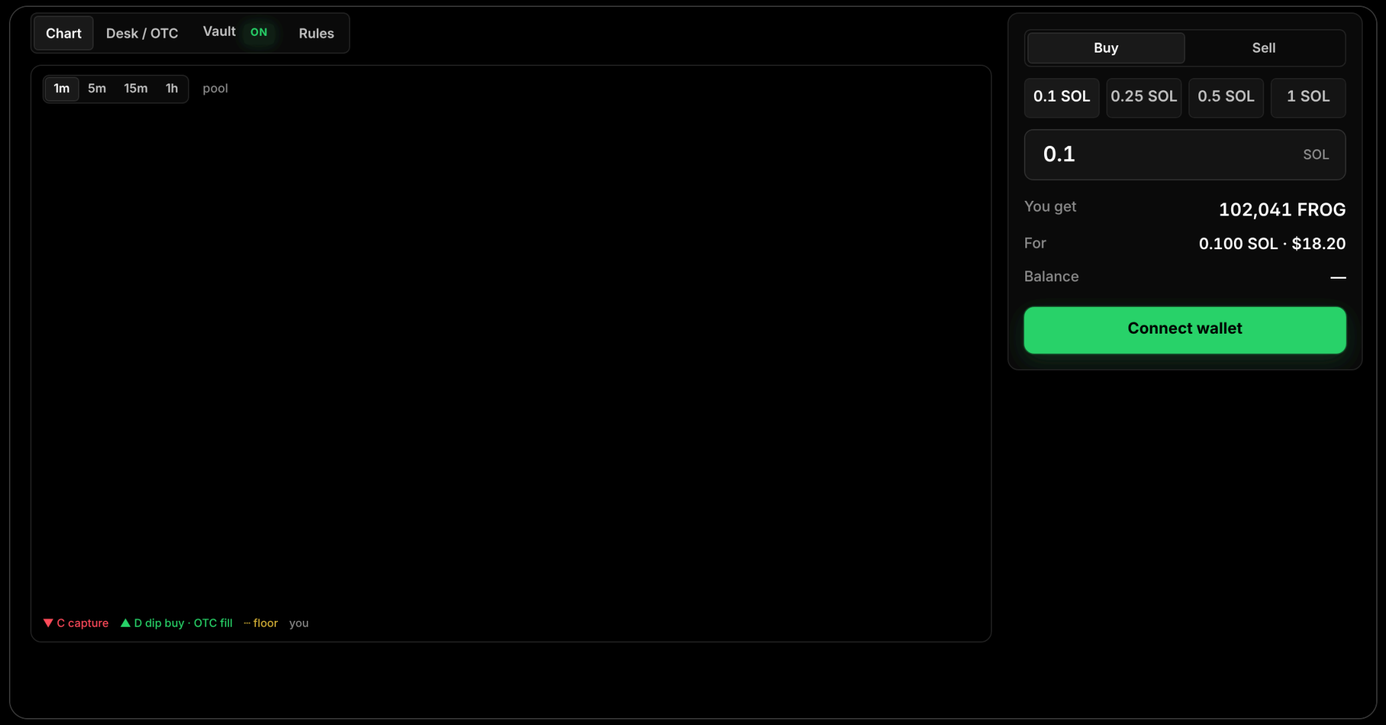

- **One button.** Sell into the best bid, or buy the best offer.
- **Bids rest 1–15% under spot.** Offers either side. Block requests ping every holder.
- **Non-custodial.** One on-chain transaction, signed by both sides.
- **The vault is always quoting**, from block zero.

VAMP DEFENSE

Copies feed the original.

On every other platform the clone wins the attention and the original bleeds. Here the clone works for the original, and anyone who bought the clone has a way back that doesn’t touch the chart.

LAUNCHING

Two venues. One signature.

- **pump.fun or Raydium LaunchLab.** On LaunchLab the 2% is enforced by Raydium's program under the BANKER config.
- **One signature** covers the coin, your buy and the chest's buy.
- **Every coin's address ends in ...BANK.**
- **Price and chart from the pool**, from the first block, in 15-second bars. No indexer.
- **Every terminal already lists both.** Launching here costs no eyes.

WHY IT IS NEEDED

Memecoins die by design. The numbers:

98.6%

of pump.fun tokens show pump-and-dump or rug behaviour

Solidus Labs · 7M tokens · 2025

The dev gets paid by dumping on holders.

<1.4%

ever reach $1,000 of liquidity

Solidus Labs · 2025

Every exit is a red candle on the chart.

$100M

of launchpad volume every day. Huge, and still broken.

The Block · Oct 2025

Copycats drain the original within minutes.

ALSO SHIPPING

The same machinery, more ways in.

Import any coin

A vault for a coin launched elsewhere: pay the fee, or let the community crowd-fund a takeover.

Burn-to-redeem

Any holder can burn tokens for their pro-rata share of the chest. The floor is real, not implied.

Sniper report

Every launch's first minute, read off the chain: who bought, how much in the launch block, what the chest took back.

Chest after launch

A coin launched without a chest gets one, free, from its coin page. Holders can add SOL or tokens to it.

Dev cut, renounceable

The creator earns a % of realized vault profit and can renounce it on chain in one click.

Terminal built in

In-app wallet, quick buy, charts from the pool, runner signals, phone-first. Phantom and Solflare too.

CREATOR REWARDS

Devs earn more by putting skin in, and only when the coin proves itself.

Lock SOL in the chest
up to 20% of fees at 3 SOL

→

Fees accrue to the dev
held, not paid

→

$50K · $150K · $250K · $500K
each held 15 min unlocks 25%

→

Paid every hour
on their dashboard

Anything still locked 30 days after launch goes to the chest, so if the coin dies the holders get it. The way to earn is to back your coin, not to dump it. Built and tested, switches on after the beta.

REVENUE · SOL AT $180

Every stream, at three sizes.

PER YEAR	HOW	EARLY 1,000 launches/yr · $1M vol/day	GROWTH 10,000 launches/yr · $10M vol/day	SCALE 50,000 launches/yr · $50M vol/day
Tax share	10% of the 2% on every curve trade	$0.73M	$7.3M	$36.5M
Desk	0.5% of SOL crossed · 10% of volume goes off-chart	$0.18M	$1.8M	$9.1M
Graduation LP	0.25% pool fee on graduated volume, locked LP is ours · 30% of volume	$0.27M	$2.7M	$13.7M
Vault performance	10% of realized market-maker profit · avg 0.3 SOL/vault/day · 20% of launches stay active	$0.39M	$3.9M	$19.7M
Imports	2.5 SOL flat per imported coin · imports = 10% of launches	$0.05M	$0.45M	$2.3M
Total		**$1.6M**	**$16M**	**$81M**

Volume = trades on BANKER-launched coins. For scale: all Solana launchpads together clear ~$100M/day; pump.fun alone books ~$1M/day in fees (The Block, Oct 2025). Tax share, desk and import fees are live today; graduation LP and vault performance fee are switches in the config.

NOBODY SHIPS THIS
